

Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of claims:

1. (Currently Amended) A method of scheduling a plurality of periodic events, wherein each periodic event has an associated periodic interval of time and an associated set of services, the method comprising:
 - determining when one of the plurality of periodic events occurs;
 - determining, for each of the set of services associated with that periodic event, if that service is enabled for execution; and
 - distributing the execution of the services associated with that periodic event that are enabled throughout a next periodic interval of time associated with that periodic event following the occurrence of that periodic event.
2. (Original) The method of claim 1, wherein one of the periodic events occurs when a periodic interval of time associated with that periodic event elapses.
3. (Currently Amended) The method of claim 1, ~~wherein distributing the execution of the services includes executing successive services on successive clock ticks following a clock tick on which that periodic event occurred~~ further comprising configuring at least one of the set of services associated with that periodic event in a one-shot mode in which the service is enabled for execution one time and then is disabled.
4. (Currently Amended) The method of claim 1, ~~wherein the execution of each of the services is either enabled or disabled~~ further comprising configuring at least one of

the set of services associated with that periodic event in a burst mode in which the service is enable for execution a predetermined number of times and then is disabled.

5. (Currently Amended) The method of claim ~~[[4]]~~ 1, ~~wherein the execution of each of the services is enabled or disabled in order to implement one of a one-shot mode, a burst mode, and a continuous mode of service execution disabled~~ further comprising configuring at least one of the set of services associated with that periodic event in a continuous mode in which the service is enable and executed continuously.

6-7. (Cancelled).

8. (Currently Amended) The method of claim ~~[[7]]~~ 1, wherein distributing the execution of the enabled services includes executing successive enabled services on successive clock ticks following the clock tick on which that periodic event occurred.

9. (Currently Amended) A system comprising:
a periodic event scheduler that schedules a plurality of periodic events, wherein each periodic event has an associated periodic interval of time and an associated set of services;

a tick generator that generates interrupts in response to clock ticks; and
an interrupt handler that receives the interrupts from the tick generator and executes the periodic event scheduler in response to the interrupt;

wherein the periodic event scheduler:
determines when one of the plurality of periodic events occurs; and
determines, for each of the set of services associated with that periodic event, if that service is enabled for execution;

distributes the execution of the enabled services associated with that periodic event throughout a next periodic interval of time associated with that periodic event following the occurrence of that periodic event.

10. (Original) The system of claim 9, wherein one of the periodic events occurs when a periodic interval of time associated with that periodic event elapses.

11. (Currently Amended) The system of claim 9, ~~wherein the periodic event scheduler distributes the execution of the services by executing successive services on successive clock ticks following a clock tick on which that periodic event occurred~~ wherein the periodic event scheduler is operable to configure at least one of the set of services associated with that periodic event in a one-shot mode in which the service is enabled for execution one time and then is disabled.

12. (Currently Amended) The system of claim 9, ~~wherein the execution of each of the services is either enabled or disabled~~ wherein the periodic event scheduler is operable to configure at least one of the set of services associated with that periodic event in a burst mode in which the service is enable for execution a predetermined number of times and then is disabled.

13. (Currently Amended) The system of claim ~~[[12]]~~ 9, ~~wherein the execution of each of the services is enabled or disabled in order to implement one of a one-shot mode, a burst mode, and a continuous mode of service execution~~ wherein the periodic event scheduler is operable to configure at least one of the set of services associated with that periodic event in a continuous mode in which the service is enable and executed continuously.

14-15. (Canceled).

16. (Currently Amended) The system of claim ~~[[15]]~~ 9, wherein the periodic event scheduler distributes the execution of the enabled services by executing successive enabled services on successive clock ticks following the clock tick on which that periodic event occurred.

17. (Currently Amended) A telecommunication device comprising:
an interface that couples the telecommunication device to a communication medium;
a tick generator that generates interrupts in response to clock ticks; and
control logic coupled to the interface that:
determines when one of a plurality of periodic events occurs, wherein each periodic event has an associated periodic interval of time and an associated set of services;
determines, for each of the set of services associated with that periodic event, if that service is enabled for execution; and
distributes the execution of the enabled services associated with that periodic event throughout a next periodic interval of time associated with that periodic event following the occurrence of that periodic event.

18. (Original) The telecommunications device of claim 17, wherein one of the periodic events occurs when a periodic interval of time associated with that periodic event elapses.

19. (Currently Amended) The telecommunications device of claim 17, ~~wherein the control logic distributes the execution of the services by executing successive services on successive clock ticks following a clock tick on which that periodic event occurred~~
wherein the control logic is operable to configure at least one of the set of services associated with that periodic event in a one-shot mode in which the service is enabled for execution one time and then is disabled.

20. (Currently Amended) The telecommunications device of claim 17, ~~wherein the execution of each of the services is either enabled or disabled~~ wherein the control logic is operable to configure at least one of the set of services associated with that periodic event in a burst mode in which the service is enable for execution a predetermined number of times and then is disabled.

21. (Currently Amended) The telecommunications device of claim 20, ~~wherein the control logic also determines, for each of the set of services associated with that periodic event, if that service is enabled for execution~~ wherein the control logic is operable to configure at least one of the set of services associated with that periodic event in a continuous mode in which the service is enable and executed continuously.

22. (Canceled).

23. (Currently Amended) The telecommunications device of claim ~~[[22]]~~ 17, wherein the periodic event scheduler distributes the execution of the enabled services by executing successive enabled services on successive clock ticks following the clock tick on which that periodic event occurred.
